No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                    US-09-890-549-4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19, Application US/08979608A
Patent No. 635451
GENERAL INFORMATION:
APPLICANT: Lees, Ann M.
Lees, Robert S.
Law, Simon W.
Arjona, Anibal A.
TITLE OF INVENTION: NOVEL LOW DENSITY LIPOPROTEIN
BINDING PROTEINS AND THEIR USES IN DIAGNOSING AND
TREATING ATHEROSCLEROSIS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
APPLICANT: Tibbetts, Scott
TITLE OF INVENTION: Peptide Compositions Which Induce Immune
NUMBER OF SEQUENCES: 36
CORRESPONDENCE ADDRESS:
ADDRESSEE: HOVEY, WILLIAMS, TIMMONS & COLLINS
STREET: 2405 Grand Boulevard, Suite 400

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Patent No. US2002013753A1

SPERRAL INFORMATION:

APPLICANT: Rosen et al.,

TITLE OF INVENTION: Wucleic Acids, Proteins, and Antibodies

FILE REFERENCE: PT223 Wucleic Acids, Proteins, and Antibodies

FILE REFERENCE: PT223 Wucleic Acids, Proteins, and Antibodies

FILE REFERENCE: PT223 Wucleic Acids, 864

CURRENT PELING DATE: 2001-01-17

Publication No. US20030233675A1

GENERAL INFORMATION:

APPLICANT: Cao, Yorgwei

APPLICANT: Gladman, Barry S.

APPLICANT: Gladman, Barry S.

APPLICANT: Gladman, Barry S.

APPLICANT: Gladman, Barry S.

APPLICANT: Gladman, USAPESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF TITLE OF INVENTION: EXPRESSION OF MICROBIAL PROPERTIES

FILE REFERENCE: 38-10(52062) B.

CURRENT APPLICATION NUMBER: US/10/369, 493

CURRENT FILING DATE: 2003-02-28

PRIOR PLILING DATE: 2002-02-21

NUMBER OF SEQ ID NOS: 47374

SEQ ID NO 14097

LENGTH: 514
TITLE OF INVENTION: GENERATION OF DIAGNOSTIC TOOLS TO ASSAY THE HUMAN TITLE OF INVENTION: LHX3/P-LIM/LIM-3 FACTOR FILE REPERENCE: 053946-5003
CURRENT APPLICATION NUMBER: US/09/932,367A
CURRENT FILING DATE: 2001.08-17
PRIOR FILING DATE: 2000-02-22
PRIOR FILING DATE: 1999-02-22
NUMBER OF SEQ ID NOS: 113

WPI; 2000-549264/50. N-PSDB; AAA53826.

New human lipid-associated proteins, nucleic acids, and antibodies, useful for diagnosis, treatment and prevention of e.g. cardiovascular disease

Claim 1; Page 76-77; 93pp; English.

Lipid-associated proteins (LIPAP) can be used for treating or preventing disorders associated with decreased expression of LIPAP, or streening for agonists or antagonists of LIPAP, and to raise specific antibodies. Antagonists and antagonists of LIPAP, and to raise for treating diseases associated with reduced or increased levels of LIPAP, e.g. cardiovascular, neurological and gastrointestinal diseases and disorders of lipid metabolism. Fragments of the nucleic acid encoding LIPAP are useful for detection of full length coding sequences, in hybridization and/or amplification assays or for diagnosis or monitoring. Nucleotides encoding LIPAP are used for compounds that specifically modify LIPAP expression, for recombinant production of LIPAP, in gene therapy, as a source of therapeutic antisense, triplex-forming, or ribozyme agents and for genomic mapping of LIPAP-associated disease by immunoassay, as antagonists, in competitive drug screens and for affinity but the LIPAP.

                                                                                                                                                            is invention describes novel polynucleotides and polypeptides isolated om human cDNA libraries which can be used for gene therapy or in caines. The polynucleotides of the invention and antibodies encoded by enay be used in the prevention, diagnosis and treatment of diseases sociated with inappropriate polypeptide expression. The products of the vention may also be used to identify modulators of expression and trivity and to down regulate expression and activity. The antibodies of elivention may also be used as diagnostic agents for detecting the esence of polypeptides in samples. This sequence represents a lypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EEQIHPRSRLRSPPBALVQGRYPHIKDGEDLKDHSTESKKMENCIGESRHEVEKSEISEN 180

```
The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as lateral sections of disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy. Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemoclactic/chemokinetic activity, heamostatic and thrombolytic activity, arthritis and inflammation, leukaemias and
                                                                                                                                  Human, nootropic; immunosuppressant; cytostatic; gene therapy; cancer; peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Humtington's disease; haemostatic; amyotrophic lateral scleroals; Shy-Drager Syndrome; chemotactic; chrombolytic; drug screening; arthritis; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Wang

```

The present sequence represents a human EPLIN (epithelial protein lost in neoplasm)-beta isoform. The specification also describes EPLIN-alpha.

EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect call proliferation. Thus the assays are useful for screening molecules with potential utility as anticancer drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligor-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of oligonucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprises a 3'-end sequence, where the polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises a 1'-end sequence, where the oligonucleotide comprises a 1'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and

                                                                                                                                                                                                                                                                                                                                                                                          482
                                                                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                        542
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240
in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDMAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDMAs. The primers allow obtaining of the full-length CDMAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH18742 represent human cDMA sequences; AAB92446 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      602
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300

ö 348 408 This invention describes novel human nucleic acid sequences from normal breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-langth gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer and for treating illnesses associated with fat metabolism. AAY48456-Y48539 represent protein fragments encoded by the expressed sequence tags described in the method of the invention. 468 180 240 588 300 648 9 の世界の世界の世界の日本 4 349 KSEVQQPVHPKPLSPDSRASSLSESSPPKAMKKFQAPARETCVECQKTVYPMERLLANQQ VFHISCFRCSYCNNKLSLGTYASLHGRIYCKPHFNQLFKSKGNYDEGFGHRPHKDLWASK 121 VFHISCFRCSYCNNKLSLGTYASLHGRIYCKPHFNQLFKSKGNYDEGFGHRPHKDLMASK RPFTVAASFQSTSVKSPKTVSPPIRKGMSMSEQSEESVGGRVAERKQVENAKASKKNGNV 361 GKTTWQNKESKGETGKRSKEGHSLEMENENLVENGADSDEDDNSFLKQQSPQEPKSLNWS 289 NELKASGGEIKIHKMEQKENVPPGPEVCITHQEGEKISANENSLAVRSTPAEDDSRDSQV 1 NELKASGGEIKIHKMEOKENVPPGPEVCITHQEGEKISANENSLAVRSTPAEDDSRDSOV RIAWPPPTELGSSGSALEEGIKMSKPKWPPE**DEIS**KPEVPEDVDLDLKKLRRSSSLKERS RPFTVAASFQSTSVKSPKTVSPPIRKGWSMSEQSEESVGGRVAERKQVENAKASKKNGNV GKTTWQNKESKGBTGKRSKEGHSLEMENENLVENGADSDEDDNSFLKQQSPQEPKSLNWS Gaps breast Rosenthal Human, EPLIN, epithelial protein lost in neoplasm, EPLIN-alpha, EPLIN-beta, tumour suppressor, tumour, cell proliferative disorder, gene therapy, cancer. neoplasm)-alpha isoform. The specification also describes EPLIN-beta.

BPLIN is a tumour suppressor protein, whose expression is altered in multiple common human furnour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use a agonist or antagonist of EPLIN, in particular molecules that affect with potential utility as anticancer drugs or lead compounds for drug with potential utility as anticancer drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polymorleocides are useful in gene therapy techniques. EPLIN is useful as a marker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DSQVKSEVQQPVHPKPLSPDSRASSLSESSPPKAMKKFQAPARETCVECQKTVYPMERLL 404

The polynucleotide sequences given in AACS9499 to AACS9497 encode the human secreted proteins given in AAB34092 to AAB34140. AAB34141 to AAB34216 represent human secreted polyneptide sequences and proteins conditions to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissue and cells the genes are expressed in Examples of activities include:

C. antiarthritic; immunosuppressive; antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; converprecetive; antibacterial; virucide; fungicide; ophthalmological; and vulnerary. The polynucleotides and polypeptides can be used to convert treat or ameliorate a medical condition in e.g. humans, mice, rabbits, poaces, horses, cats, dogs, chickens or sheep. They are also used to in diagnosing a pathological condition or susceptibility to a condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperproliferative disorders e.g. neoplasms or

The invention relates to novel human proteins (ABB56417-ABB56425) wi cancer suppressing function, the encoding polynucleotides (ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB9970-ABB970-

Human protein able to suppress growth of cancer cells and its coding

cancer of the breast or liver, cardiovascular disorders, cerebrovascular disorders, angiogenesis, nervous system disorders, infections caused by bacteria, viruses and fungi and ocular disorders. The polypeptides can also be used to aid wound hand and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC59440 to AAC59448 and AAB34091 represent sequences used in the exemplification of the present invention.

                                    The invention relates to a novel human sterol regulatory element binding protein 3 (hSREBB-3) expressed in human normal hypothalamic tissue and its coding sequence. Also described is the process for preparing the protein and nucleic acid sequence, and the method for detecting hSREBP-3 nucleic acid sequence and polypeptides. The present sequence represents the amino acid sequence of human hSREBP-3 as described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  759

New nucleic acid molecules encoding 49 human secreted proteins for diagnosing, preventing or ameliorating medical conditions and used for food additives or preservatives -

```
Polymorlectides sequences AAC934179 - AAC93527 represent CDNA encoding human secreted proteins AAB51827 - AAB51875. Sequences AAB51876 - AAB51927 represent alternative polymorphyseptides encoded by the genes, and amino acid sequences with which they share homology. The genes and cannot be acid sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they are expressed. Examples of their activities include immunosuppressive, antiarchitic; antirheumatic; antiproliferative; cytostatic, cardiant; cvasotropic; carebroprotective; notropic; neuroprotective; antibaccerial; virucide; fungicide; opthalmalogical; and agonists may be useful in treating, preventing and/or diagnosing diseases and disorders such as autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative cureating, preventing and/or diagnosing diseases and disorders such as autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative consolations caused by bacteria, viruses and fungi and ocular disorders e.g. cardiac arrest, creebrovascular disorders e.g. corneal infections repolypeptides can also be used to aid wound the calling and epithelial cell proliferation, to prevent skin aging due to subburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The carbonates of acrease storage capabilities, fat content, lipid, protein, carbobotrides can also be used as a food additive or preservative to carbobotrides Autanition, minerals, cofactors and other nutritional components. Oligomuclectides AAC93470 - AAC93470 and peptide AAB51826 are components. Oligomuclectides AAC93470 - AAC93470 and peptide and characterisation of the proteins and characterisation of the proteins and characterisation of the proteins and characterisation of the proteins and characterisation of the proteins and characterisation of the proteins and characterisation of the proteins and characterisation of the proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          592
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          652
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              473 EILERPAQLANARETPHSPGVEDAPIAKVGVLAASMEAKASSQQEKEDKPAETKKLRIAW
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 EILERPAQLANARETPHSPGVEDAPIAKVGVLAASMEAKASSQQEKEDKPAETKKLRIAW

```
This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AA773814-Y74252 represent protein fragments encoded by the human pancreatic tumor cDNA library defined expressed sequence tag (EST) sequences represented in
                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human nucleic acid sequences from pancreatic tumors, and related

                                                                                                                                                                                                                                                                                                                                                                                AXCS8773 to AACS9231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AABS4008 to proteins, called pancreatic cancer antigens have cytostatic, carcar antigens have cytostatic, carcardant and antiminfaumatory relaxant, contraceptive, nootropic, immunomodulatory, relaxant, contraceptive, cytostective, neuroprotective, mootropic, immunomodulatory, relaxant, contraceptive, cytostective, neuroprotective, and antiminfaumatory activities, and can be used for cytostective, treating, or ameliorating amedical condition or in assays for diagnosing partners to the proteins and the activity of the cytostective. Binding partners to the proteins and the activity of the cytostectic ann be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Cytostectic cancer antigens can be used for. The pancreatic cancer antigens can be used in chromosome mapping, linkage and hybridisation probes that can be used in chromosome mapping, linkage and diagnostic methods. The proteins can be used to persign and a variety of forensic can diagnostic methods. The proteins can be used to proteins can be used to proteins can be used to proteins can be used to protein cand target the polypeptides, including to both in vivo and in vitro diagnostic and therapeutic methods. The cortic of proteins can be used to pract or treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or percented to the present invention.
                                                                                                                                                                                                                                                                     New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliorating a medical condition, particular pancreatic cancer, or for use in assays for diagnosing a pathological condition
                                                                                                                                                                                                                                                                                                                                                      Claim 11; Page 1050-1051; 1379pp;

The invention relates to isolated polymucleotide (I) and properion (FC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The chromosome can gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags con restore normal activity of (II) as useful in gene therapy techniques con to restore normal activity of (II) or to treat disease states involving curantiating a polypeptide in tissue, as molecular weight markers and as can propose a polypeptide in tissue, as molecular weight markers and as confiscates involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in capposition, for generic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and can produce other types of data and products dependent on DNA and can amino acid sequences of the invention.

CNOTE: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from MIPO can thought int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                            Claim 20; SEQ ID No 54449; 103pp; English
